

What is Machine Learning?

Timeline

Since an early flush of optimism in the 1950s, smaller subsets of artificial intelligence – first machine learning, then deep learning, a subset of machine learning – have created ever larger disruptions.

History and Examples

- Machine Learning
 - Grew out of work in AI
 - New capability for computers
- Examples
 - Database mining
 - Large datasets from growth of automation and web
 - Web click data, medical records, biology and engineering
 - Applications can't program by hand
 - Autonomous helicopter, handwriting recognition, most of Natural Language Processing (NLP) and computer vision
 - Self-customizing programs
 - Amazon, Netflix product recommendations
- Understanding human learning (brain, real AI)

Definitions

- Arthur Samuel (1959). **Machine Learning**: Field of study that gives computers the ability to learn without being explicitly programmed.
- Tom Mitchell (1998). **Well-posed learning problem**: A computer program is said to *learn* from experience E with respect to some task T and some performance measure P , if its performance on T , as measured by P , improves with experience E .

Illustrated Explanation

Learning

You said "Hello."

"Hi."

"How are you?"

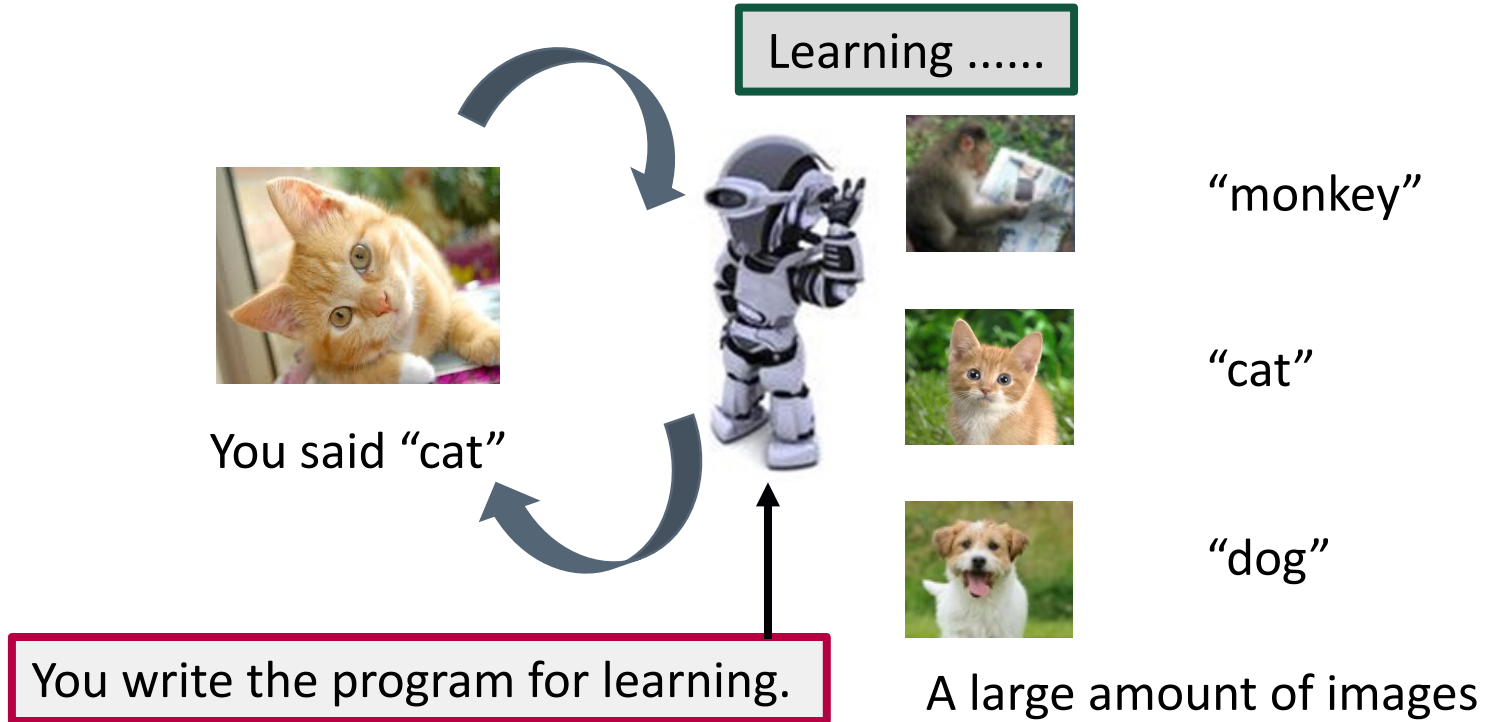

"Goodbye."

You write the program for learning.

A large amount of audio data

Illustrated Explanation, Cont'd

Machine Learning \approx Looking for a Function

- Speech recognition

- Image recognition

- Playing Go

- Dialogue system

$f(\text{"How are you?"}) = \text{"I am fine."}$
(what the user said) (system response)

Image Recognition: $f(\text{Image}) = \text{"cat"}$

Framework: Part I

A set of
function

Model

$f_1, f_2 \dots$

f_1

$= \text{"cat"}$

f_2

$= \text{"monkey"}$

f_1

$= \text{"dog"}$

f_2

$= \text{"snake"}$

Image Recognition: $f(\text{image of cat}) = \text{"cat"}$

Framework: Part II

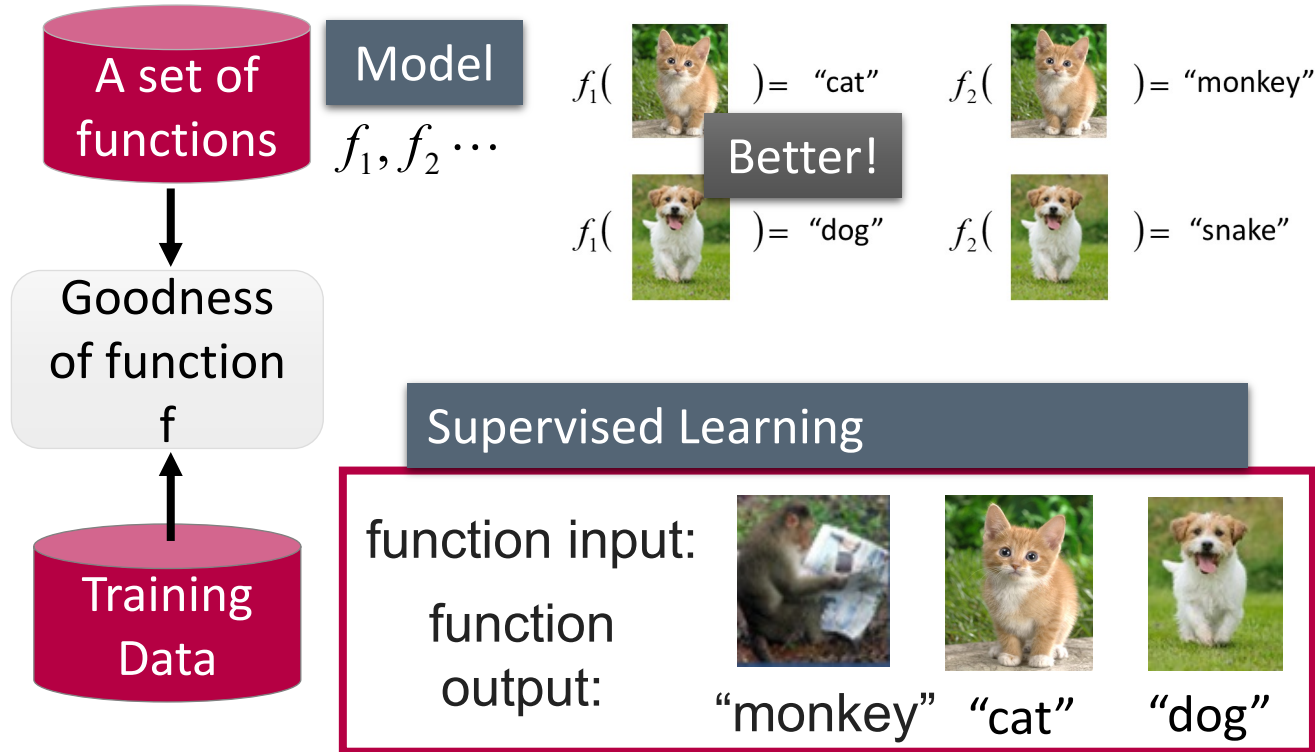

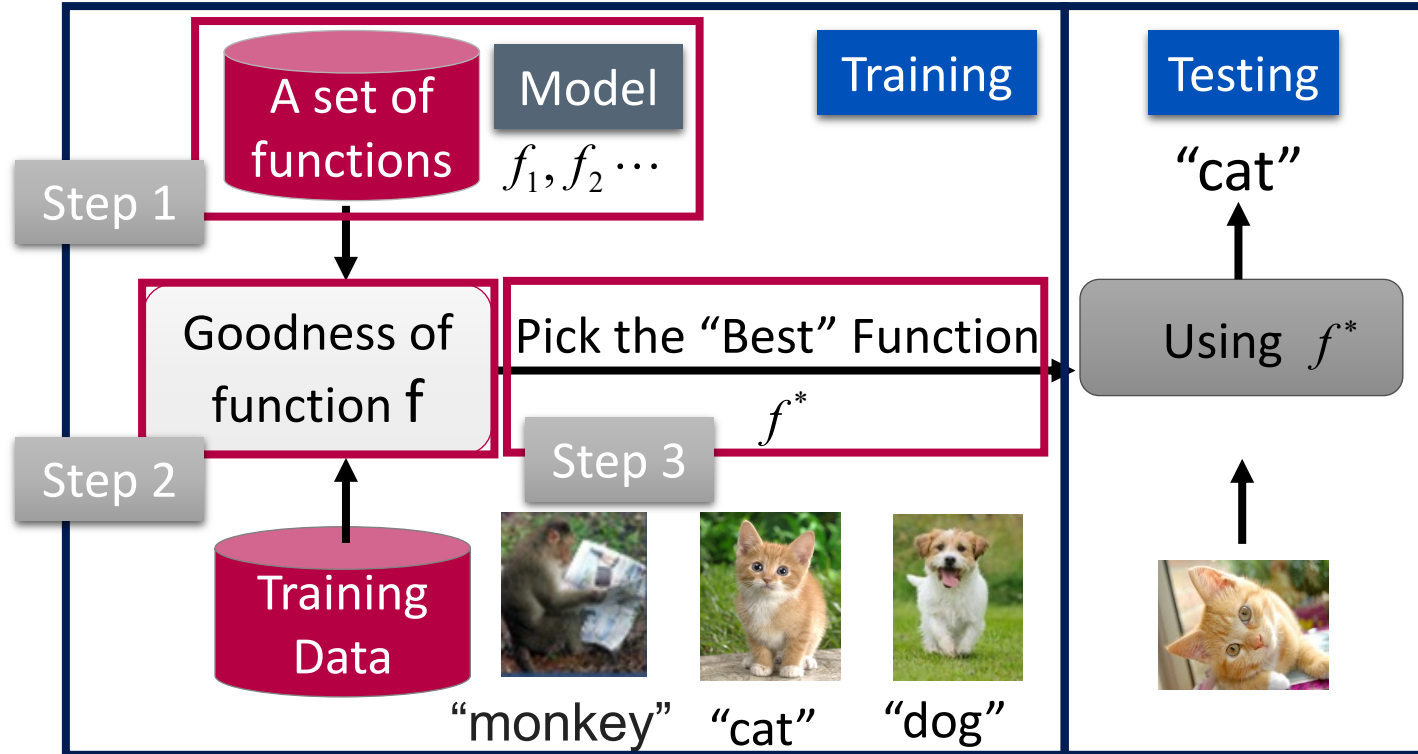

Image Recognition: $f(\text{Image of a cat}) = \text{"cat"}$

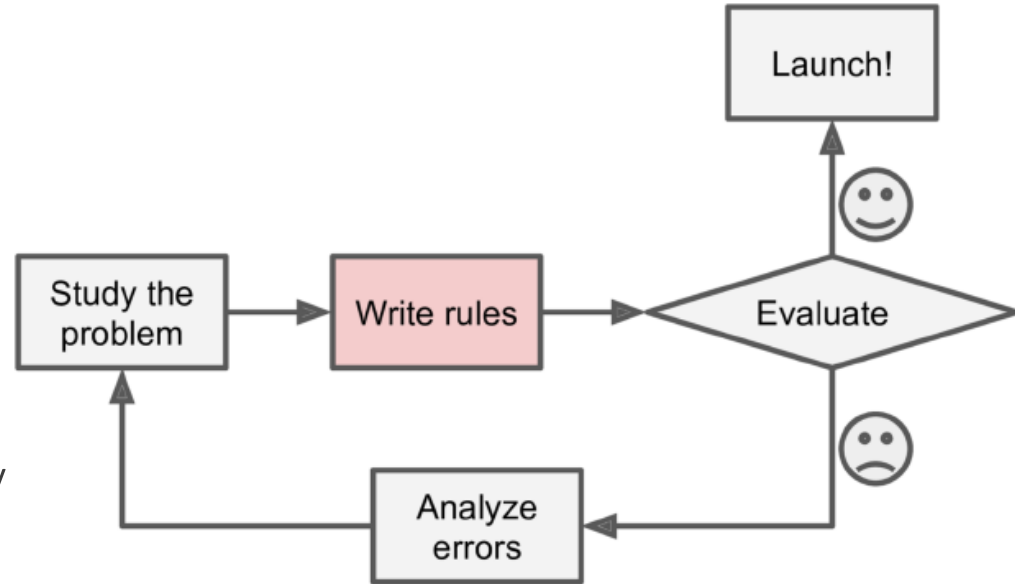

Framework: Part III

Machine Learning is not Rule Based

Issues with rule-based systems:

- Very labor intensive to build
- Rules cannot generalize to unanticipated input combinations
- Do not naturally handle uncertainty
- Expert systems seen as “brittle”

The Machine Learning Approach

- Do not reverse engineer an expert's decision process.
- Machine “learns” on its own.
- We provide the “training data”.
